More Info

Version	0.1.0
Released on	20/01/2020 08:40:23
Last updated	22/03/2020 13:14:55
Publisher	Kurosh
Unique Identifier	Kurosh.flutter-mvc-generator
Report	Report Abuse

Example

If you give parameter for class name as `home`, the extension will create a directory structure like this

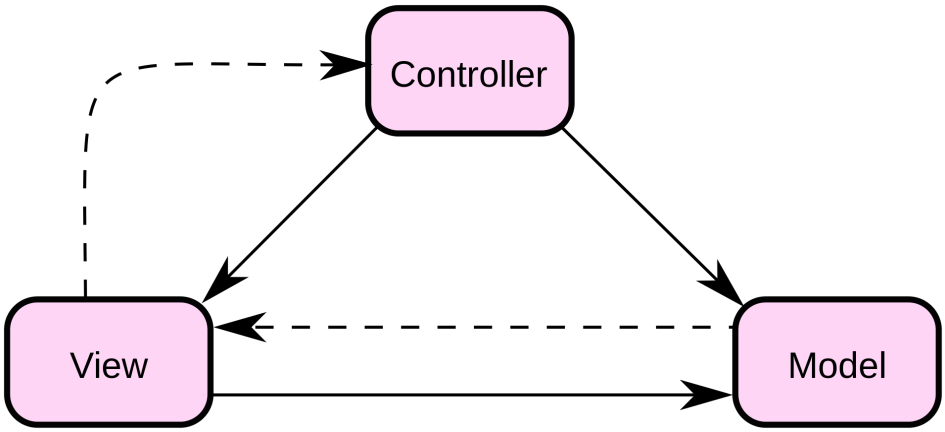

```
--root
    |-- android
    |-- ios
    |-- lib
        |-- components
        |-- models
            |-- home
                |-- home_model.dart
        |-- views
            |-- home
                |-- components
                |-- layouts
                |-- home_view.dart
        |-- main.dart
    |-- test
    |-- pubspec.yaml
```

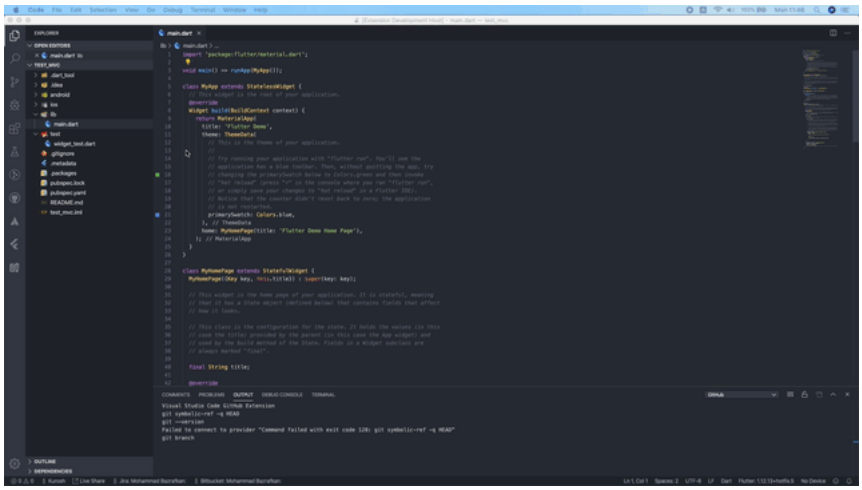

It will also add the following dependencies to the `pubspec.yaml` file

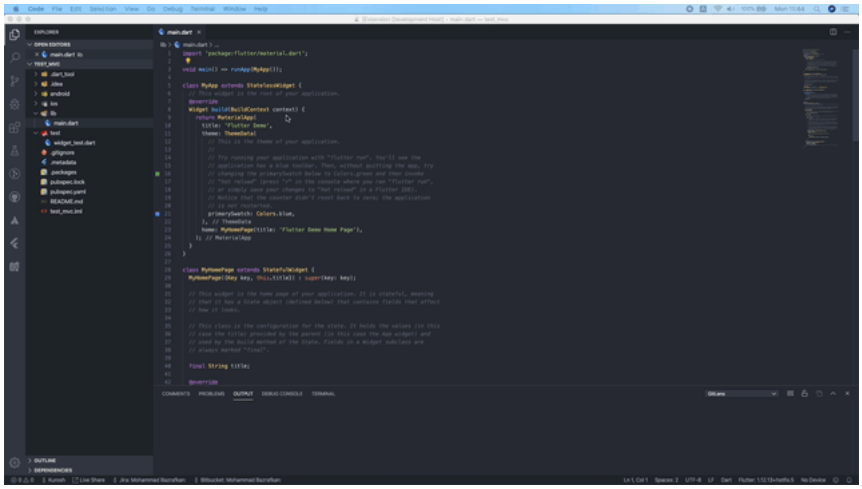

- provider: ^4.0.4

Create MVC

The create MVC command or menu will add a **MVC**.

Example

If you give parameter for class name as `home`, the extension will create a directory structure like this

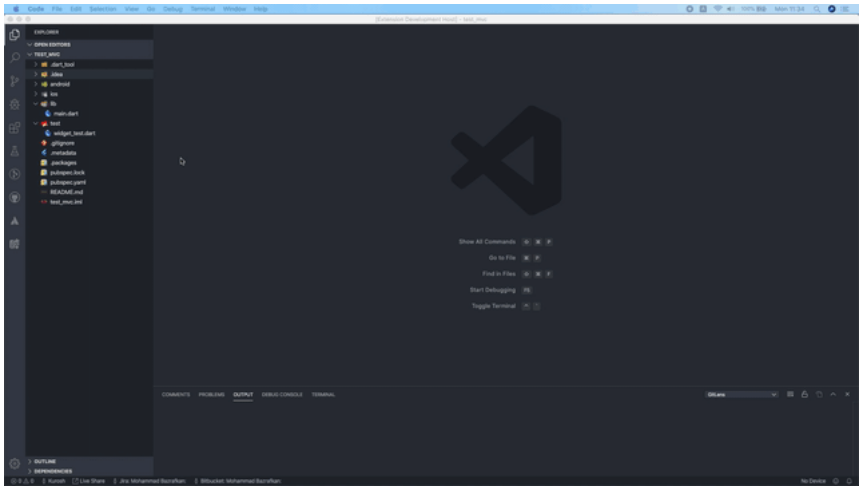

```
--root
    |-- android
    |-- ios
    |-- lib
        |-- components
        |-- models
            |-- home
                |-- home_model.dart
        |-- views
            |-- home
                |-- components
                |-- layouts
                |-- home_view.dart
        |-- controllers
            |-- home
                |-- home_controller.dart
        |-- main.dart
    |-- test
    |-- pubspec.yaml
```

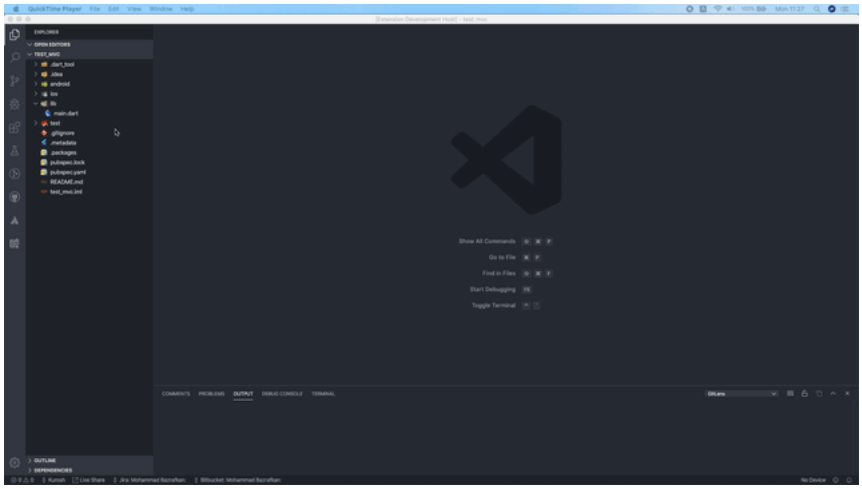

It will also add the following dependencies to the `pubspec.yaml` file

- provider: ^4.0.4

Create Model

The create model command or menu will add a **Model**.

Example

If you give parameter for class name as `home`, the extension will create a directory structure like this

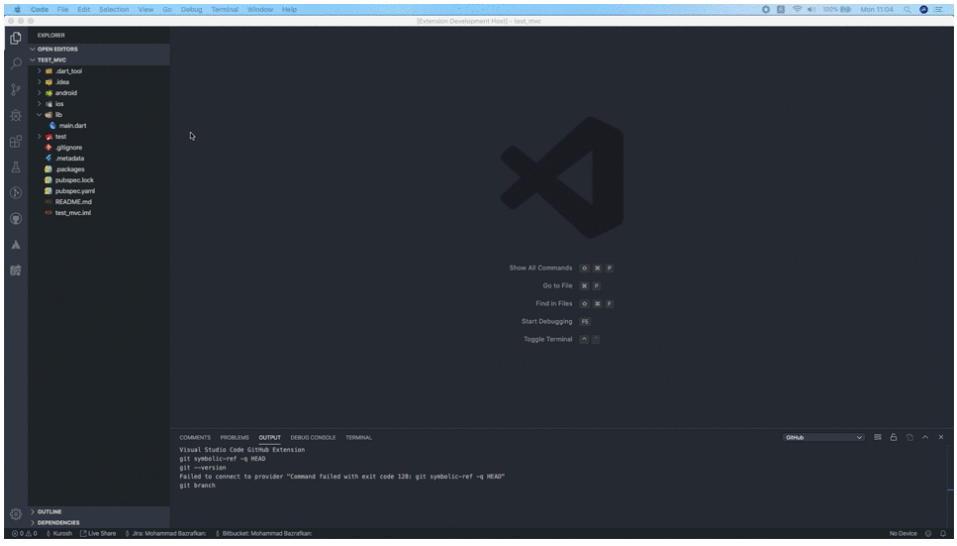

```
--root
    |-- android
    |-- ios
    |-- lib
        |-- models
            |-- home
                |-- home_model.dart
        |-- main.dart
    |-- test
    |-- pubspec.yaml
```

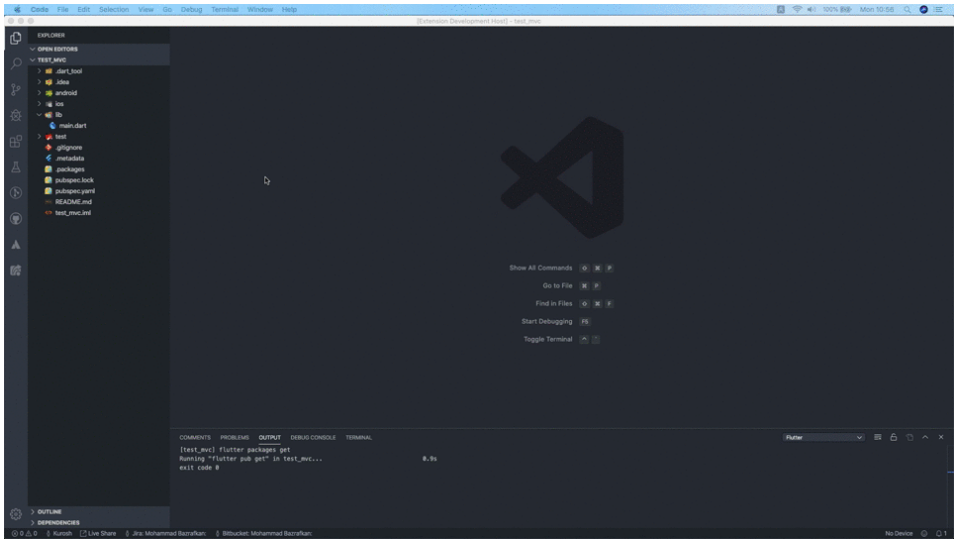

It will also add the following dependencies to the `pubspec.yaml` file

- provider: ^4.0.4

Create View

The create view command or menu will add a **View**.

Example

If you give parameter for class name as `home`, the extension will create a directory structure like this

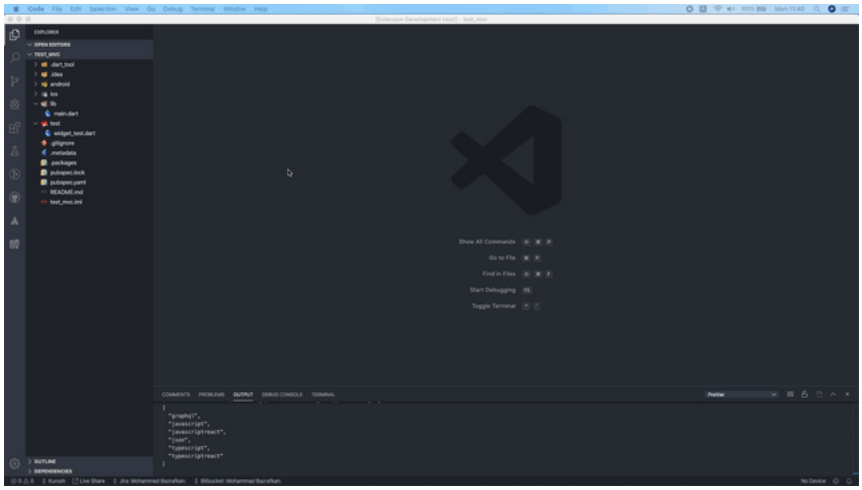

```
--root
    |-- android
    |-- ios
    |-- lib
        |-- components
        |-- views
            |-- home
                |-- components
                |-- layouts
                |-- home_view.dart
        |-- main.dart
    |-- test
    |-- pubspec.yaml
```

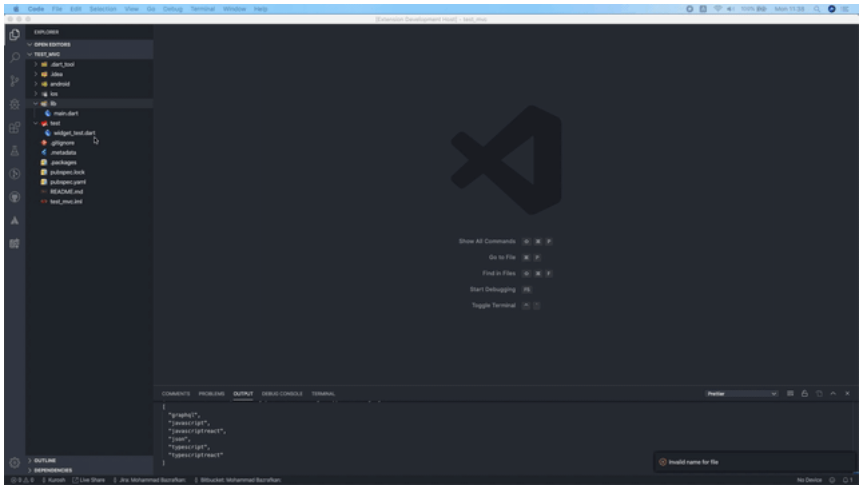

It will also add the following dependencies to the `pubspec.yaml` file

- provider: ^4.0.4

Create Controller

The create controller command or menu will add a **Controller**.

Example

If you give parameter for class name as `home`, the extension will create a directory structure like this

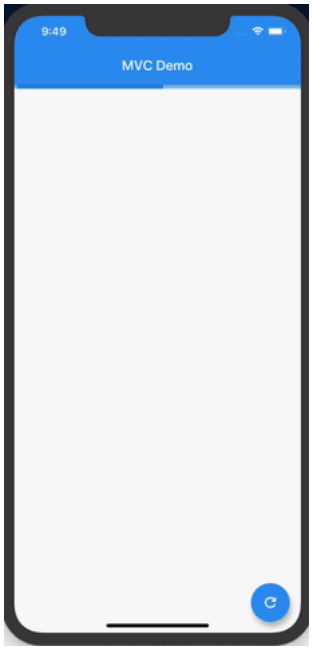

```
--root
    |-- android
    |-- ios
    |-- lib
        |-- controllers
            |-- home
                |-- home_controller.dart
        |-- main.dart
    |-- test
    |-- pubspec.yaml
```

It will also add the following dependencies to the `pubspec.yaml` file

- provider: ^4.0.4
